

Cougar Data System – Current Dataflow (input → output)

Two views of the same flow: a **Mermaid** diagram (renders in VS Code/GitHub/most slide tools) and an **ASCII** fallback for printing or pasting where Mermaid won't render.

Mermaid

ASCII fallback

How to read it (speaker note)

- **Three input rails:** automated (Polar → AI photo), assisted (Telegram bot, Google Form), and manual (web-app forms / CSV). Everything funnels into **one database — Google Sheets**.
- **The app is a cache, not the source:** it reads the Sheet on launch, works offline, and syncs changes back through the **Apps Script auth gateway** (per-device token).
- **Outputs are all derived from that single store:** dashboard, growth charts, the battalion-format **parade state**, the **safety status board**, and **email sendout**.
- **One source in, many products out** — that's the whole pitch in one picture.
