

Cougar Company Data System — Battalion HQ Pitch Deck

Slide-by-slide draft. Each slide = on-screen content (keep it sparse) + speaker notes (what you say).

Fill every [bracket] with your real numbers before presenting. Target: ~18–20 min + Q&A.

Structure — two acts:

- **ACT 1 (Slides 1–11): The app today at Cougar.** What it is, how people actually use it, what it does for us, and its honest drawbacks.
- **ACT 2 (Slides 12–18): Feasibility & battalion-wide.** What every appointment gets, the battalion roll-up, how other companies adopt it, security, and the ask.

Read the Speaker Cheat-Sheet at the bottom first — it maps every person in the room to the one thing they care about.

ACT 1 — How it works for Cougar today

Slide 1 — Title

On screen:

- **40 SAR Cougar — Company Data System**
- One source of truth, from the section line to battalion HQ
- [Your rank/name/appointment] · [date]

Speaker notes:

10 seconds. "I'm going to show you a system we built and have been running in Cougar. First how it works for us day-to-day — including where it falls short — then what it would take to give

the whole battalion one accurate picture."

Slide 2 — The problem (the hook)

On screen:

- Parade state is rebuilt by hand, every day, from WhatsApp + memory
- Conduct attendance, LMS, IPPT — captured, then thrown away
- No single place to ask "how is our training actually going?"
- At handover/POP, the company's memory is lost

Speaker notes:

Get the room nodding before features. "In most companies the COS rebuilds parade state daily from report-sick timings and conduct attendance scattered across chats. The harder data — IPPT, LMS — someone parses by hand. It works, but it's fragile, manual, and none of it accumulates into anything we can decide from." Pause. "This is the company's memory."

Slide 3 — What it is (30-second framing)

On screen:

- A phone-first web app + Google Sheets backend
- Updated from the ground in seconds (no laptop)
- [N] recruits · [N] modules · [N] conducts archived
- *Screenshot of the sidebar*

Speaker notes:

"One sentence: a single source of truth any commander updates from their phone, on the ground, in seconds. No server to buy, no app to install — Google Sheets underneath, so it's free and familiar."

Slide 4 — Accessibility: built for zero friction (*the "people will actually use it" slide*)

On screen:

- **No install, no app store** — it's a URL, opens in any phone browser
- **Log in once** — invite link redeems a device token; never log in again
- **Works offline** — data is cached on the device; reads are instant, syncs when signal returns
- **Data is just *there*** — auto-pulls on launch; search by 4D or name; scope to platoon/section in one tap
- **Onboard a whole team in one message** — drop one bulk-invite link in the group chat; each phone self-registers

Speaker notes:

This is the adoption argument — make it explicitly. "A data system only works if people actually use it, and people don't use things with friction. So: nothing to install, you log in once per device and never again, and it works with no signal — it reads from a local cache and syncs in the background. When you open it, the data's already there; you search a 4D and you're looking at the man in two seconds." For onboarding: "I can bring a whole company on with a single link in the group chat — each phone registers itself." Low friction is *why* the data stays current.

Slide 5 — Core features (grouped, not a list)

On screen — 4 buckets:

Bucket	Covers
 Accountability	Roster · Attendance · Leave/Out · Conducts
 Training safety	Medical · MSK trends · HA expiry · Report Sick
 Performance	IPPT · Route March · SOC · Polar HR analytics
 Field usability	Telegram bot · AI photo capture · offline sync

Speaker notes:

"Twelve modules, four jobs." Name each bucket in a line. "Let me show the two that change how we see the company — the heart-rate analytics and the AI data capture."

Slide 6 — DEMO 1: Training effectiveness (*performance data*)

On screen:

- Tap a recruit → growth graphs over the cycle
- **Efficiency** = kcal / avg HR · **Intensity** = avg HR / max HR
- **Recovery** = max-HR trend at same workload (fitness vs. fatigue)
- **Workload** = avg HR × duration (cardiac load → periodisation)
- Company-wide: conduct participation, fallout & report-sick patterns

Speaker notes:

Do this LIVE on your phone. "This is a recruit's fitness across the cycle — not raw numbers, but training-science metrics. Recovery flags overtraining before it's an injury; workload lets us periodise instead of guess. Aggregate it and the OC/SM see MSK trends, IPPT progression, who's falling out repeatedly — decisions on evidence, not feel."

Slide 7 — DEMO 2: Getting data IN with minimal friction (*automation*)

On screen:

- **AI photo capture** — photograph the Polar class summary → every recruit's HR/cal/duration extracted, matched to roster, unclear rows flagged
- **Telegram bot** — update status from the field, no laptop, no app
- **Google Form** — MSK/physio self-reports flow straight in
- **Email** — push status/Polar summaries out to the chain

Speaker notes:

Ties back to Slide 4. "The hardest part of any data system is getting data *in* — so we automated the three worst chokepoints." Show the AI photo capture. "It reads every row, matches each 4D to our roster, and *flags* what it can't read rather than silently dropping a recruit. Plus a Telegram bot for field updates and a Google Form for injury self-reports — easy to bolt new inputs on."

Slide 8 — Parade state & the safety status board (*company-level, today*)

On screen:

- Generates **First / Last Parade** state in the battalion WhatsApp format — one tap to copy
- OTHERS, MEDICAL APPT, in-camp / out-of-camp all composed automatically
- Live **status board**: who's MC, LD, MC+1/+2, RMJ, each Excuse-status
- MC+1/+2 ghost tags computed automatically · HA-expiry warnings

Speaker notes:

"Today this generates our parade state in the exact battalion format — the COS taps once to copy it into the chat, instead of typing it from scratch." Then for the safety angle: "It also compiles a live status board — every status, with MC+1 and MC+2 computed automatically so nobody tracks that on paper, plus heat-acclimatisation expiry warnings. A safety brief that builds itself." (This sets up the battalion roll-up in Act 2.)

Slide 9 — Reliable information input (*the honest answer on accuracy*)

On screen:

- Parade state is only as good as its last input — same as today, but with less friction
- **Time-bounded entries**: log "out 1130 / in 1630" *once* → state auto-reflects the right status at any time in between
- **Self-service**: commander books in/out from his own phone (Telegram) — no single COS bottleneck
- **Fail-safe**: overdue book-in shows as "*pending verification*," not silently "absent"
- **Human-in-the-loop**: COS/PS still verify before sendout

Speaker notes:

Pre-empt the killer question — raise the sendout example yourself. "A commander books out 1130, in 1630. Parade state at 1300 must show him out. Who inputs that, and what if he forgets to book in?" Answer honestly: "You enter the window *once* and the system computes his status by current time — no one re-touches it. If he overshoots, he surfaces as *pending verification*, not wrongly absent. The COS still verifies before sending, exactly like today — we've just made that faster and harder to get wrong." Own the weakness; show the mitigation.

Slide 10 — What it does for Cougar

On screen:

- 🕒 **Manpower** — daily parade-state rebuild & data entry: hours → minutes
- 🛡️ **Safety** — HA expiry + MSK trends + clean status board caught *early*
- 🇺🇸 **Decisions** — OC/SM act on participation, fallout & fitness trends, not gut feel
- 📁 **Accountability** — every conduct archived; nothing lost at handover/POP

Speaker notes:

Translate to what command values: saved man-hours and reduced risk. "The COS stops rebuilding the picture from scratch daily. The OC and SM get trend lines they've never had. And the company's data survives the next handover."

Slide 11 — Honest drawbacks (*close Act 1 on credibility*)

On screen:

- **IPPT / LMS extraction still manual** — I parse it by hand to keep errors low
- **Data-entry discipline** is the real battle — the automation exists to lower that bar
- **Built on constraints** — Sheets-as-database meant engineering our own sync/conflict handling; no server meant a per-device token system
- **Key-man risk** — today it leans on one maintainer

Speaker notes:

Close Act 1 by naming the limits — it's what makes the strengths believable. "I'll be straight about where it falls short. IPPT and LMS are still hard to extract cleanly, so I do that by hand for now. The hardest problem isn't code — it's getting consistent data entry. And right now it leans on me; if we scale, we resource that deliberately." Then pivot: "So — does this transfer beyond Cougar? That's the rest of the brief."

ACT 2 — Feasibility & battalion-wide implementation

Slide 12 — One system, every appointment (*the pivot — what battalion-wide gives each of you*)

On screen — table:

Who	What battalion-wide gives you
S1	Accurate parade state, consolidated to battalion level
S2	Per-device auth, revocable access, controlled data
S3	Battalion dashboard · training-effectiveness data · Form & Telegram automation
RSM / CESP	Accurate, <i>meaningful</i> Polar data + participation tracking
SPECs (ground)	Reliable in-camp / out-of-camp strength, live
PCs / chief safeties	Clean compiled status list — who's LD, MC+1, excused what

Speaker notes:

The pivot from "works for Cougar" to "works for all of you." Say each line *to* that person. "You've seen it run one company. Scaled to the battalion, here's what each of you gets — S1 a consolidated parade state, CESP Polar data you can trust, the SPEC on the ground a reliable in/out count, PCs a clean safety list. Same data, one source, every level."

Slide 13 — Battalion parade state roll-up (*the centrepiece for S1*)

On screen:

- Each company runs its own instance (own sheet, own data)
- Battalion **pulls** from all companies → one consolidated parade state
- Read-only at battalion — companies stay independent & in control
- *Simple hub-and-spoke diagram: companies → battalion dashboard*

Speaker notes:

The slide S1 is waiting for. "Because every company instance is identical, battalion can pull from all of them and consolidate into one accurate strength state — without touching any company's data. One number, traceable down to the recruit." Be honest on status: "The company side is live; this roll-up is the build I'm asking to resource."

Slide 14 — Feasibility for other companies

On screen:

-  **Low cost** — Google Sheets + Apps Script, free, no procurement, no server
-  **Low barrier** — runs on any phone, nothing to install (same accessibility you saw in Act 1)
-  **To adopt:** copy Sheet → bind & deploy script → set frontend URL → issue invites
-  **Honest:** needs Polar watches for the fitness side + one tech-comfortable maintainer per company

Speaker notes:

"Standing up a new company is roughly [your estimate] — and I've written a setup guide, so it's repeatable, not tribal knowledge. The real dependencies are honest ones: Polar watches for the

fitness data, and one maintainer per company. A sister company is already attempting the port — real evidence it transfers."

Slide 15 — Challenges in adapting it battalion-wide

On screen:

- **Standardisation** — companies must agree on status vocabulary & roster format (the roll-up is only as clean as the least-consistent company)
- **Identity** — 4D numbers repeat across companies → namespace by company
- **Resilience** — one company offline must not break the battalion view (show partial + flag)
- **Maintenance** — a maintainer per company + someone who owns the battalion layer

Speaker notes:

"Scaling isn't just copy-paste, and I want to be honest about the work. The biggest one isn't technical — it's standardising how companies record statuses, because the battalion picture is only as clean as the least-consistent company. The rest are solvable: namespacing IDs, handling a company being offline gracefully, and planning maintenance."

Slide 16 — Data security (*for S2 — anticipate it*)

On screen:

- Per-device token auth — no open/public access to data
- Invite-only onboarding; every device revocable individually
- Battalion roll-up is **read-only** — companies retain control of their data
- **For official adoption:** flag for proper data-classification review

Speaker notes:

Raise it before S2 does. "Access is per-device and invite-only — I can revoke any single device, no public link. The battalion view reads up; it never writes down, so companies keep control." Then concede the right thing: "If this becomes an official battalion system, it should go through a proper data-handling review — I'm flagging that now rather than waiting to be asked."

Slide 17 — The ask / next steps

On screen:

- I'm requesting: **[pick one]**
 - Endorsement to pilot in [1 more company]
 - Resource the **battalion roll-up** build + a maintainer plan
 - Approval to standardise across the battalion
- I can stand up the next company in [timeframe]

Speaker notes:

End on a decision, not "thank you." "I'm not asking the battalion to commit today. I'm asking to resource the roll-up and pilot it in one more company — so we have a second data point and a real battalion parade state to evaluate. Next company running in [timeframe]." Make the yes small.

Slide 18 — Backup: architecture & numbers (*only if asked*)

On screen:

- Front end: vanilla JS web app (no framework, no build, works offline)
- Backend: Google Apps Script (bound to the Sheet) · Data: Google Sheets, one tab per module
- Integrations: Telegram · Claude AI (photo extraction) · Google Forms · email
- Roll-up: aggregator pulls each company's `readAll` API → merges
- **By the numbers:** [N] recruits · [N] conducts archived since [date] · [N] Polar sessions · [X] min/day COS admin saved

Speaker notes:

One minute, no jargon, only if someone technical asks. One real number beats a paragraph of adjectives — pull these live before you present.

Speaker Cheat-Sheet — say *their* line to *their* face

Appointment	What they want	Slide to land it	The one sentence to say to them
S1	Accurate battalion parade state	13 + 9	"You get one consolidated strength state, traceable to the recruit — and here's exactly how we keep the inputs honest."
S2	Security	16	"Per-device, revocable, read-only at battalion — companies keep control of their own data."
S3	Bn dashboard · effectiveness · automation	6 + 7 + 13	"Training effectiveness as data, three automated input paths, and a battalion dashboard that pulls it all together."
RSM / CESP	Polar accuracy & participation	7 (+6)	"It flags unreadable Polar rows instead of dropping recruits — data you can stand behind — plus participation tracking and email-out."
SPECs (ground)	Reliable in/out-camp numbers	4 + 9	"It works offline, opens in two seconds, and a missed book-in flags for review instead of marking a man absent."
PCs / chief safeties	Compiled status list	8	"Your safety brief builds itself — every status, MC+1s computed automatically, HA expiry warnings, filtered to your conduct."

Delivery checklist

- ☐ Replace every [bracket] with real figures
- ☐ Charge your phone — Slides 6, 7, 8 are live demos

- ☐ Pre-load the app + pick one recruit with good Polar data; have a fallback screenshot
- ☐ Rehearse the **Slide 9** sendout-commander answer until it's smooth — your toughest question, pre-empted
- ☐ Know your one-line transition from Act 1 → Act 2 (end of Slide 11)
- ☐ Decide your single ask (Slide 17) before you walk in
- ☐ Print the Speaker Cheat-Sheet — glance at it, name people by appointment
